

Geldium Delinquency Project — Simulation Closure Summary

Tata iQ · GenAI Powered Data Analytics Job Simulation (Forage) · Completed August 1, 2026

Industry & Problem Statement

Industry: Financial services / consumer lending — specifically the collections and credit risk function, which manages customers who fall behind on loan or credit payments (auto loans, credit cards, personal loans) while staying compliant with fair-lending regulation.

Company: Geldium, a lending/financial services company, working with Tata iQ (an AI analytics consulting practice) to modernize how it predicts and manages customer delinquency.

Core problem: Geldium's existing process for spotting at-risk customers wasn't good enough. The simulation asked: can we predict delinquency before it happens, which customer signals actually matter, and how do we act on predictions automatically and fairly at scale? That question was broken into four sequential tasks, each building on the last.

What We Did, Task by Task

Task	Goal	What Was Produced
1. Exploratory Data Analysis (EDA)	Assess data quality and find early risk indicators in the 500-customer dataset before modeling.	Word report: missing-value handling plan, flagged inconsistent labels and outliers,
2. Predictive Modeling Plan	Conceptually design a model (no code) to score delinquency risk.	Word plan: logistic regression recommended as the primary model for interpretability
3. Business Report & Data Storytelling	Translate technical findings into a plain-language brief for the Head of Collections.	One-page Word report: top 3 risk factors, one SMART recommendation (proactive
4. AI-Driven Collections Strategy	Design how the model would run as a live, semi-automated system.	Executive PowerPoint deck: data → decision → action → learning-loop workflow, a

How We Did It

The throughline across all four tasks was using GenAI as a thinking partner, not a black box: GenAI helped explore the dataset, structure model logic, and draft language for each deliverable, but every claim was checked against the actual data — correlations, group averages, and sample sizes — rather than assumed. That is also the core skill being tested: the ability to use AI tools while still exercising independent judgment about what is actually true in the data.

Outcome

Four deliverables were produced — an EDA report, a modeling plan, a business report, and an executive deck — that tell one consistent story end-to-end. The same core finding (the debt-to-income × credit-utilization risk segment) surfaces in each document, adapted for a different audience:

- Task 1 (analyst audience): a statistical pattern worth investigating further
- Task 2 (data science audience): an engineered feature driving model design
- Task 3 (business audience): the basis for a concrete, measurable action
- Task 4 (executive audience): the trigger condition for an automated outreach workflow

That consistency is itself a demonstration of the underlying skill being assessed: translating one data insight into the right register for each audience.

Simulation Completion

Status: **Completed August 1, 2026**. A completion certificate is available for download and can be added to LinkedIn's Licenses & Certifications section.

Skills demonstrated:

- AI Analytics & AI Strategy
- Exploratory Data Analysis
- Data Quality Management
- Model Selection & Validation
- Predictive Analytics
- Analytical Reporting
- Business Communication & Data Interpretation
- Ethical Reasoning & Regulatory Compliance
- Process Automation
- Strategic Thinking & Decision Making

These map directly onto the four deliverables produced above, so each one can be spoken to concretely in an interview using this project as a real example — not generic resume language.
